## **SPECIFICATIONS** Subject to change without notice.

<b>Power Requirements</b>	120 VAC, 60 Hz for wall pack (provided) operation 12 VDC to 16 VDC @ 600 mA maximum. Fused on circuit board.
<b>Dimensions</b>	9" x 4" x 7" inches
<b>Weight</b>	DR10 - 5 lbs, DR20 - 5 lbs, DR30 - 5 lbs, DR40 - 5 lbs.
<b>Audio Output to Speaker</b>	2 Watts at 3% THD into 8 ohms, using supplied wall pack or 12 VDC.
<b>Handset Earpiece Level</b>	Adjustable via internal potentiometer.
<b>Frequency Response</b>	+/- 3dB from 300 to 3000 Hz. 1000 Hz reference.
<b>Hum and Noise</b>	50 dB below operating levels
<b>Compression</b>	Less than 3 dB increase in output with 30 dB increase in input beyond threshold. Threshold is adjustable from -20 dBm to +10 dBm.
<b>Line Impedance</b>	600 ohms or 5000 ohms, dip switch selectable.
<b>Line Output Level</b>	Factory set at 0 dBm. Adjustable to +15 dBm maximum.
<b>Control Currents</b>	Dip switch selection of eight possible control current configurations composed of the following current levels: -15mA, -6mA, -2.5mA, +2.5mA, +6mA and +15mA.
<b>Operating Modes</b>	Standard: Two wire simplex. Two wire duplex. (Trunking mode, jumper selectable.)  Optional: <b>-4W</b> Four wire simplex. Audio on one pair and control currents on the other. <b>-FD</b> Full duplex on four wires. TX audio and control currents on one pair, RX audio on the second pair.
<b>Available Factory Options</b>	-M Push button monitor. -2F F1 / F2 push button. Current format is dip switch selectable. -I Push button intercom between remotes.

Please note: Some options are standard on some models. Some options not available on all models or in combinations with other options. **No options are field installable.**

### **General Description**

The DR series DC remotes are designed to provide remote control of a conventional or trunked two way radio base station or repeater via a leased wire line or in-house twisted pair.

The DR series is available in four different housing configurations. They are: the DR10 telephone style unit with handset, the DR20 desktop console with desk microphone, the DR30 desktop console with built in electret condenser microphone and the DR40 desktop console with goose neck microphone.

Standard features on all DR models include front panel PTT switch, line operated transmit indicator, off-hook monitor function(DR10), RX and TX audio compression, two watt amplified speaker with volume control, line continuity sensor and parallel cross mute capability.

The DR10, 20, 30 and 40 may be wall mounted by ordering the -WM option. When wall mounting the DR20 please note, no provisions are made for mounting the desk microphone.

## **Pre-Installation Considerations**

The DR series DC remotes are designed with protection against both power and telephone line surges. This protection circuitry requires the use of a properly grounded AC outlet. If the remote is to be powered directly from DC the wall plug-in transformer is not used.

### **Phone lines**

The DR series is designed to work with a good quality leased metallic pair (phone line) or in house twisted pair wiring. The maximum dc loop resistance, including the termination panel, cannot be greater than 10,000 ohms.

### **Parallel operation**

When several remote control units are connected in parallel the total system impedance will decrease to a point where operation is degraded.

To compensate for this effect, DR series remotes provide a dip-switch selectable 600 or 5000 ohm termination impedance.

In parallel remote installations using the same phone line, dip switch 7 should be in the OFF position (5000 ohms), in all remotes except the last one in the chain. For multi-point installations using more than one phone line the above procedure applies to each phone line.

Up to ten DR series DC remotes may be connected in parallel. The maximum loss between any remote and the termination panel must not exceed 20dB.

## **Installation**

### **Connections**

Phone line connections are made using the supplied modular line cord. Power consist of plugging the wall pack in to the nearest properly grounded AC outlet. If the remote is to be powered directly from a DC source, disconnect the wall plug-in transformer from TB1 and connect a well grounded 12 to 16 volt DC supply. The positive lead should connect to TB1 pin 1. The negative lead should connect to TB1 pin 2.

**Control Current Settings** - Table 1 shows the eight possible control current combinations available in the DR series remote. Switches 1, 2 and 3 of the dip switch are used to select the desired control current format. They are accessible on the underside of the remote.

**Table 1**

<b>PTT (F1)</b>	<b>PTT (F2)</b>	<b>Mon (F1)</b>	<b>Mon (F2)</b>	<b>Switch 1</b>	<b>Switch 2</b>	<b>Switch 3</b>
+15mA				OFF	OFF	OFF
+6mA				ON	OFF	OFF
+15mA		+6mA		OFF	ON	OFF
+15mA		-6mA		ON	ON	OFF
+6mA		+2.5mA		OFF	OFF	ON
+6mA		-2.5mA		ON	OFF	ON
+6mA	+15mA	-2.5mA	-2.5mA	OFF	ON	ON
+15mA	-15mA	+6mA	-6mA	ON	ON	ON

### **Field Selectable Configuration Settings**

The DR series remotes are designed to be as user / technician friendly as possible and provide a wide range of field selectable options. These dip switch selectable and jumper selectable options give the DR series great flexibility in the field.

Table 2 illustrates the field configuration settings that are dip switch selectable.

**Table 2**

Switch #	ON	OFF
4	Phone line polarity is reversed.	Phone line polarity normal.
5	Speaker volume can be turned all the way down.	Speaker volume can not be turned all the way down.
6	Speaker active on-hook.	Speaker active all the time.
7	600 ohm termination.	5000 ohm termination.
8	DR10	DR20

**Jumper Settings**

The DR series DC remotes have 21 solder dot jumpers on the PCB. Jumpers are considered to be "in" when solder has been applied to form a short from one side to the other. Jumpers are considered to be "out" when no solder has been applied and the circuit is open from one side to the other. Remove the four housing screws and open housing to access jumpers.

The following describes field selectable jumper functions.

<b>JU19 - Off-hook monitor function.</b>	Generates monitor current when handset is off-hook. IN = disabled, OUT = enabled. Must be IN for DR20, DR30 and DR40.
<b>JU20 - Parallel Transmit Indication (PTI).</b>	Energizes PTT indicator when a parallel remote keys, locks out TX audio and disables control current generation from this remote. IN = disabled, OUT = enabled. See "Setup Adjustments" for adjustment procedure.
<b>JU16 - Cross Mute.</b>	Mutes speaker when a parallel remote keys. IN = enabled, OUT = disabled. Requires PTI enabled and adjusted.
<b>JU14 - Trunking option for 2 wire system.</b>	Allows trunking status tones to be heard in earpiece while remote is keyed. IN = disabled, OUT = enabled. Can not be used for DR20, DR30 or DR40 in 2 wire system.
<b>JU17 &amp; JU18 - High Loop Resistance.</b>	Allows use of PTI on DC loops with 6K to 10K resistance. IN = Loop resistance is 6K to 10K. OUT = Loop resistance is less than 6K. Ignore if PTI not enabled.

A description of all jumper functions appears on the schematic next to the jumper.

**Line Continuity Sense**

This feature will tell you, via the PTT LED, if your DC loop continuity has been lost.

If the unit is keyed and there is no DC loop continuity, the PTT LED will not illuminate. When the unit is unkeyed, the PTT LED will flash once.

There are no adjustments for this feature.

**Setup Adjustments**

The following adjustments assume that the termination panel has been properly installed.

## **Receive Line Input Adjustment**

The receive line input, R92, adjusts the audio level to the input of the compression amplifier circuitry. This allows the threshold of compression be adjusted from -20 dBm to +10 dBm.

While applying an RF signal modulated with a 1000 Hz tone at 60% system deviation to base station receiver, adjust the termination panel line output control for 0 dBm to the phone line. Adjust each remote as follows:

- a. Connect a scope or analog AC volt meter to ground and pin 14 of U8.
- b. With R92 fully counter clockwise, adjust in a clockwise direction until the AC voltage level on scope or meter just stops increasing. This point is the threshold of compression.
- c. Remove the RF Signal from the base station.

## **Transmit Line Out Adjustment**

This level is preset at the factory for 0 dBm out to the phone line and should not require readjustment at installation. If needed, the procedure is as follows:

1. With the handset off-hook (if applicable) depress the PTT switch and adjust the mod out pot (R63), while speaking in a normal voice, until 0 dBm is measured across the phone line at the termination panel.

## **Microphone Sensitivity**

R64 controls the microphone audio level into the transmit compression circuit and therefore acts as a sensitivity control. This potentiometer has been factory set to provide adequate compression for normal voice audio with a relatively quiet background noise level.

## **PTI (Parallel Transmit Indication) Adjustment**

If you do not need the PTT indicator to be line operated and you are not using the cross mute feature you may skip the following procedure.

Before making the following adjustments, please verify that: The chosen control current format matches the requirements of the termination panel being used at the radio base station or repeater site. See Table 1 for dip switch settings.

The remote must be connected to the termination panel via your in house wiring or leased wire line.

**1)** Remove the four housing screws that secure the top half of the housing. Set the unsecured top half of the housing to the right of the remote. Do not unplug the ribbon cable from the bottom unit.

**2)** With the remote powered up, depress and hold the PTT switch. The red PTI LED (DS5) on the base board, PCB in lower half of housing, should illuminate. If it is illuminated go to step 3. If it is not illuminated adjust R176 counter-clockwise until the PTI LED illuminates.

**3)** Release the PTT switch. The PTI LED (DS5) should no longer be illuminated. If it is still illuminated, proceed to step 4. If it is not illuminated, verify once more that the PTI LED comes on when the PTT switch is depressed and goes out when it is released. If this is true then proceed to step 6.

**4)** Since the PTI LED (DS5) is still on you must adjust R176 clockwise until it just goes out. If you reach the end of adjustment of R176, it clicks as you turn it, and the PTI LED (DS5) is still on, proceed to step 5. If PTI LED (DS5) goes out, verify once more that the PTI LED comes on when the PTT switch is depressed and goes out when it is released. If this is true then proceed to step 6.

**5)** Power down the remote. Install solder dot jumpers JU17 and JU18. Return to step 2.

**6)** Remove solder dot jumper JU20. Adjustment complete.

## **Circuit Analysis**

### **Receive Audio Path**

Receive audio from the phone line enters through transformer T3. The control for Receive line input, R92, adjusts the signal level passed to the compression amplifier formed by U8. The compression amplifier operates by sampling the output of U8-C through R107 and C57 and then rectifying it with D21 and D20. The rectified dc voltage, which varies as the receive audio level varies, controls the impedance of Q4. The varying impedance of Q4 controls the signal level input to U8-A. C40 and R77 control the compressor attack and decay time. U8-D and its associated circuitry form a high pass audio filter which reduces 60 Hz components by as much as 40 dB.

The compressor output is passed on through the front panel volume control to speaker drivers U3 and U4. The compressor output is also fed through R94 to the earpiece amplifier circuitry.

### **Transmit Audio Path**

Mic level audio is fed to preamp U7-A or U7-D, depending on which mic is used. Preamplified transmit audio

is routed through audio gate U10-A or U10-C, depending on which mic is used, to the mic level adjustment R64. R64 sets the signal level passed to the compression amplifier formed by U2. The compression amplifier operates by sampling the output of U2-A through R33 and C27 and then rectifying it with D5 and D6. The rectified dc voltage, which varies as the transmit audio level varies, controls the impedance of Q3. The varying impedance of Q3 controls the signal level input to U2-C. C30 and R35 control the compressor attack and decay time. U2-B and its associated circuitry form a high pass audio filter which reduces 60 Hz components by as much as 40 dB.

The compressor output is gated through U6-C and fed to the phone line driver circuit of U5-A and U5-C. U5-A and U5-C form a push-pull amplifier to drive transformer T3.

### **Control Current Generation**

Activation of the PTT, Monitor or Hook-Switch off-hook will cause U12 pin 10, labeled High Voltage Start, to go low. This pulls pin 4 of U1 to .77Vdc causing it to output a »15Vdc square wave at »50kHz on pins 9 and 10. This output is pulse width modulated by U1 to provide the appropriate voltage at HIGH VOLTAGE+ and HIGH VOLTAGE-. U7-B is configured to limit high voltage output to 190Vdc. The voltage at HIGH VOLTAGE+ and HIGH VOLTAGE- is continuously adjusted by U1 to maintain a constant current level which is regulated by U7-C. The current level is determined by the control format chosen via dip switches 1, 2 and 3 (See table 1) and the control function, PTT or Monitor, selected at the time.

### **Parts List**

DR Series main PCB #700-DRBB-200 Rev. B

## *Warranty*

CPI Communications warrants each product manufactured by it to be free from defective material and workmanship and agrees to remedy any such defects or to furnish a new part in exchange for any part of any unit of its manufacture which under normal installation use or service discloses such defects, provided the unit is delivered by the customer to our authorized service center intact, with all transportation charges pre paid within two years from date of shipment to the original purchaser. Exceptions are semiconductors which carry only the manufacturer's standard warranty and lamp indicators and fuses which are warranted to be operational when shipped from the factory. No credit will be given for unauthorized repair.

This warranty does not extend to any of our products which have been subjected to misuse, neglect, accident, incorrect wiring not our own, improper installation, or to use in violation of instructions furnished by us nor extended to units which have been repaired or altered outside of our factory or authorized service center, nor to cases where the serial number thereof has been removed, defaced, or changed, nor to accessories used therewith not of our own manufacture, nor to finish or appearance items.

This warranty is in lieu of all other warranties expressed or implied and no person is authorized to assume for us any other liability in connection with the sale of our products.

Please Note: CPI products are not authorized for use in applications where nonperformance may be life threatening, or where substantial risk to life and property may be present, without express written consent of the president of CPI Communications. CPI Communications shall never be liable for consequential or indirect damages.
